

To Whom It May Concern,

I am pleased to recommend **Pham Le Anh Thu** for Data Scientist, Machine Learning Engineer, AI, or Advanced Analytics positions. During her internship at Amgen, Thu took ownership of developing an MVP for a quota recommendation solution supporting supply chain planning. Throughout the project, she consistently demonstrated strong analytical ability, ownership, and a genuine commitment to delivering practical business value. She learns quickly, takes initiative, and can be trusted to solve complex problems with increasing independence.

Thu worked across the full data science project lifecycle, from understanding business requirements and validating data quality to exploratory data analysis, model development, evaluation, and deployment. She developed and evaluated multiple forecasting approaches, including XGBoost, ARIMA, and SARIMAX, selecting the most appropriate methods based on business requirements and model performance.

One of her most significant contributions was transforming an initial single-country prototype into a scalable forecasting pipeline covering 28 countries across EMEA. Rather than applying the same solution universally, she developed a comprehensive exploratory data analysis to identify differences in demand patterns across countries and grouped markets with similar characteristics to support more appropriate modelling strategies. She redesigned the pipeline by replacing hard-coded logic with dynamic configuration, enabling automated monthly execution without manual intervention. To improve long-term reliability, she also implemented performance thresholds that automatically flag underperforming cases for review, making the solution more scalable, maintainable, and production-ready.

What particularly impressed me was Thu's analytical judgement. Rather than accepting model outputs at face value, she consistently questioned unexpected results and investigated their underlying causes. During model evaluation, she identified several cases where poor forecasting performance stemmed from data quality issues rather than modelling limitations, including inconsistencies in source data and insufficient historical data. She systematically improved the preprocessing and evaluation pipeline, resulting in more reliable model comparisons and greater confidence in the final business recommendations.

Beyond her technical contributions, Thu showed remarkable professional growth throughout her internship. Thu dug into the business requirements and problems as opposed to taking simple direction. She made the project her own, becoming the technical implementation expert because of her domain knowledge development. She became increasingly independent, moving from executing defined tasks to identifying issues, proposing practical improvements, communicating risks clearly, and driving work forward with minimal supervision.

Thu is also a collaborative and dependable team member. She welcomed feedback, communicated effectively with colleagues from different backgrounds, and consistently sought to

understand both the technical and business context behind her work. She approached challenges with curiosity, resilience, and professionalism, earning the trust of the people around her.

I am confident that Thu has the technical foundation, analytical mindset, and professional maturity to succeed in a data science or AI-focused role. More importantly, she has the curiosity, ownership, and practical problem-solving ability to continue learning and delivering meaningful impact as projects become increasingly complex. I have no doubt that she will be a valuable addition to any team, and I recommend her without reservation.

Sincerely,

A handwritten signature in blue ink, appearing to read 'Radu Stancut', with a stylized, flowing script.

Radu Stancut
